

# Latest Cosmic Ray Results from IceTop and IceCube

Matthias Plum  
for the IceCube collaboration  
<[matthias.plum@marquette.edu](mailto:matthias.plum@marquette.edu)>

## Outline:

- Introduction to CRs & IceTop/IceCube
- Energy spectrum and composition
- Low energy muons in IceTop
- PeV Gamma ray searches
- PeV Neutron searches
- Summary

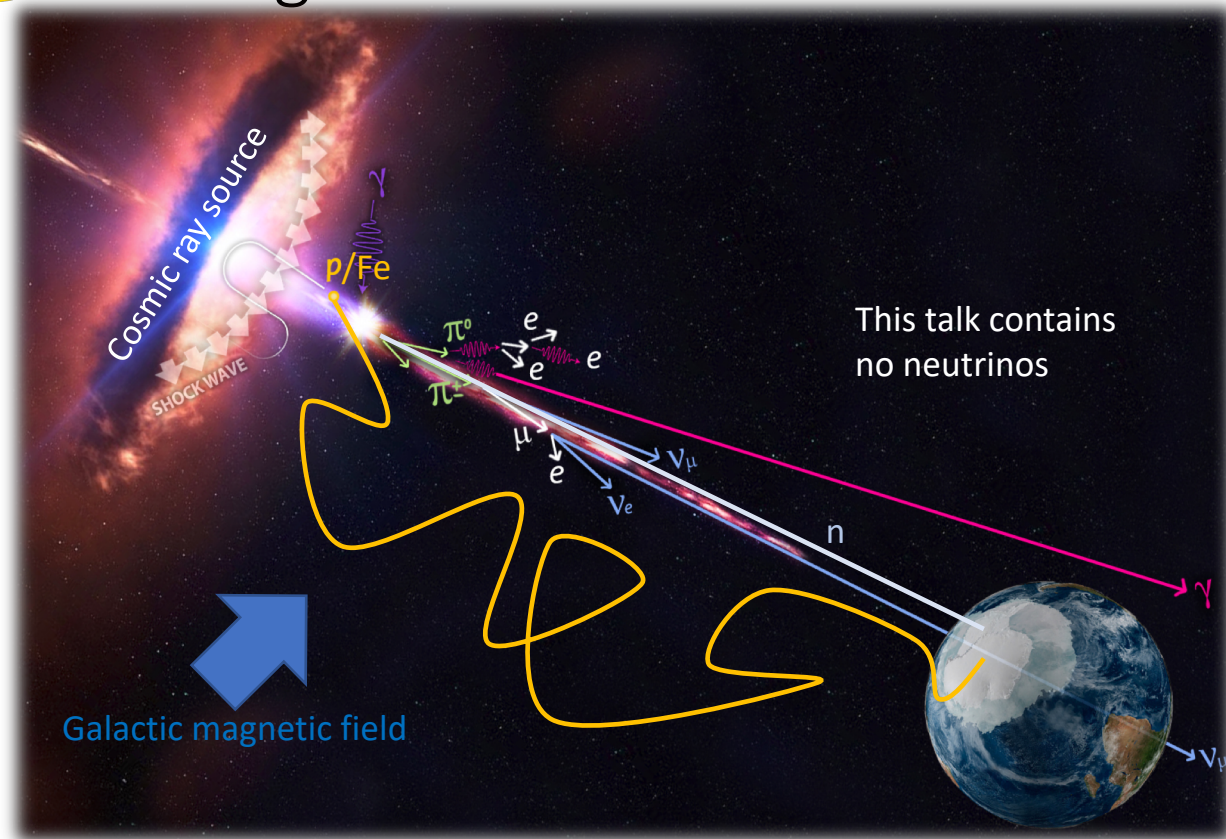

# Cosmic Rays Multi-Messenger Search

Goal:

Looking for the origin of galactic cosmic rays

Explain the structure in the energy spectrum, e.g. knee, second knee, ....

- CR particle deflected (charge dependent)
- High energy  $\gamma$  and neutrons hard to measure

# IceCube Observatory

Deployed over 6 seasons:  
Completed in 2011

IceCube String

Digital Optical Modules(DOM)

**IceTop (Surface Air Shower Array):**

- ~1 km<sup>2</sup> instrumented area
- 81 stations with 2 tanks each
- 2 DOMs per tank → 324 total DOMs
- Measure electromagnetic and low energy muon components of air shower

**IceCube (In-Ice Array):**

- ~1 km<sup>3</sup> instrumented volume
- 86 strings with 60 DOMs each with 17m spacing → 5160 total DOMs,
- Depth: 1.45-2.45 km
- Measure high energy muon component of air shower

**Same DOMs used for IceCube and IceTop**

# IceTop

## IceTop Tank

- 2 DOMs per tank
- 2.3 m<sup>3</sup> ice

2010 November

2011 November

2012 November

# IceTop-Only Reconstruction

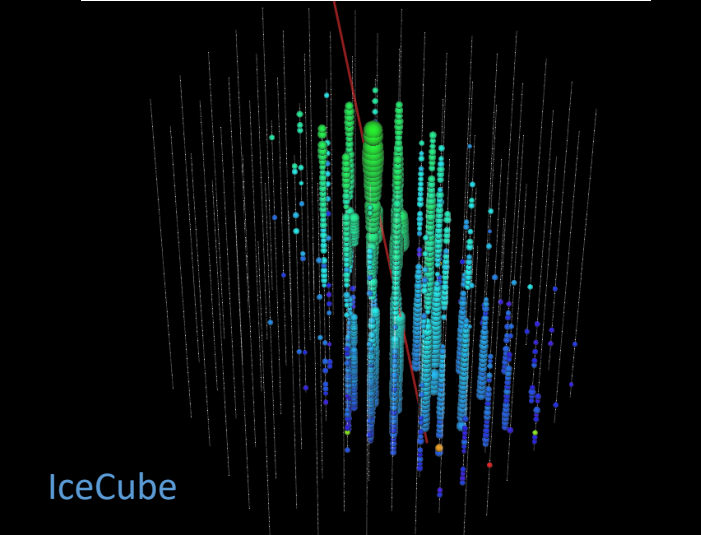

IceTop

Lateral signal distribution in VEM:

$$S(R) = S(R_0) \left(\frac{R}{R_0}\right)^{-\beta - \kappa \log_{10}\left(\frac{R}{R_0}\right)}$$

(Double Logarithmic Parabola)

IceCube

December 11, 2018

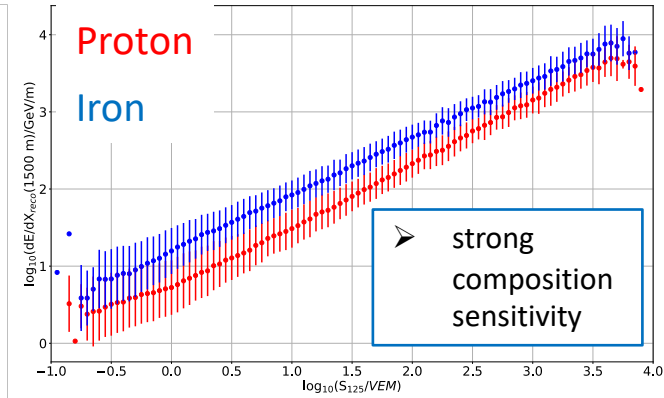

- Energy reconstruction using maximum-likelihood procedure
- Reconstruct core position, direction and shape/normalization of LDF from the deposited charge
- Includes effects snow coverage by assuming an 'effective attenuation length'  $\lambda$  (range 2.10 – 2.25m)

# IceCube/IceTop Coincidence Reco.

IceTop

## High energy muons (>500 GeV)

- Energy and mass proxy reconstruction with neural network technique
- Use best available detector simulation including snow coverage

# IceTop/IceCube - Neural Network Reconstruction

IceTop

$\log_{10}(S_{125})$

$\cos(\text{zenith})$

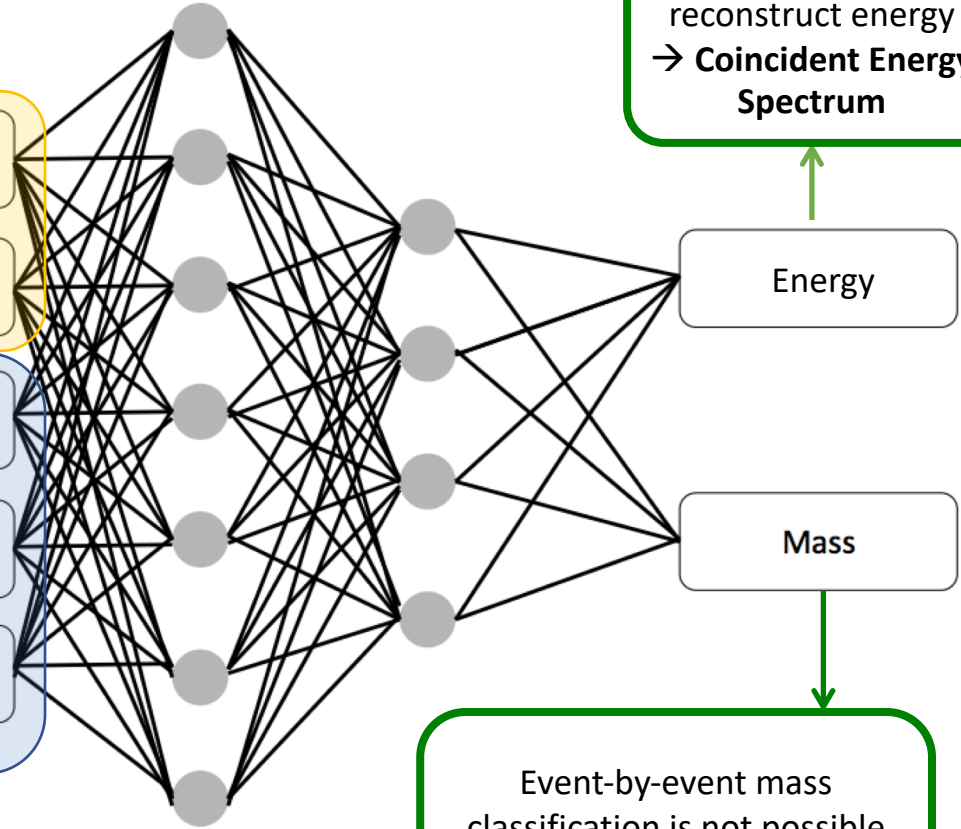

$\log_{10}(dE/dX)$

Nr. of HE stochastics  
(standard selection)

Nr. of HE stochastics  
(strong selection)

IceCube

*J. Phys.: Conf. Ser. 718 052033*  
*Proceedings of ICRC2013(0861)*  
*Astropart.Phys. 42: 15, 2013*

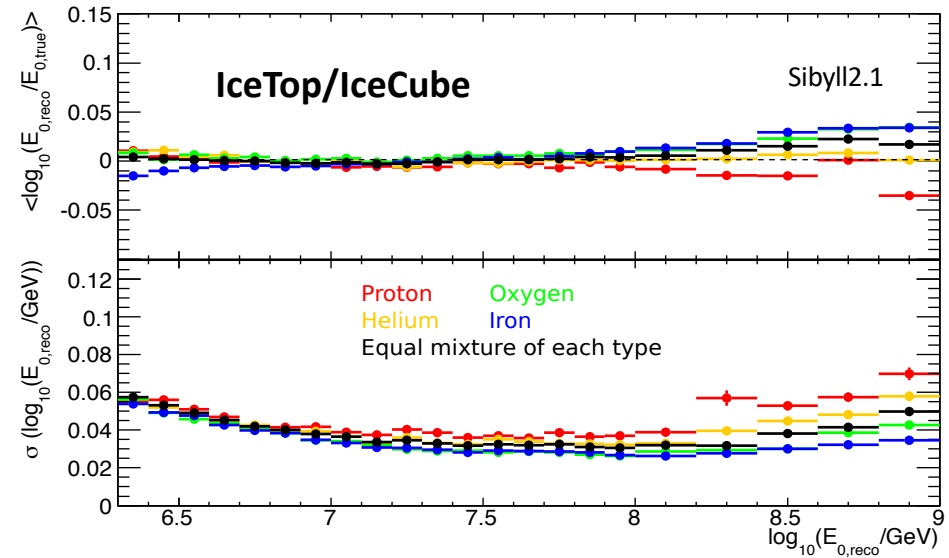

Use NN to directly reconstruct energy  
→ **Coincident Energy Spectrum**

Energy

Mass

Event-by-event mass classification is not possible  
→ **Analyze mass as a function of energy on a statistical basis**

# Energy Reconstruction & Resolution of Both Analyses

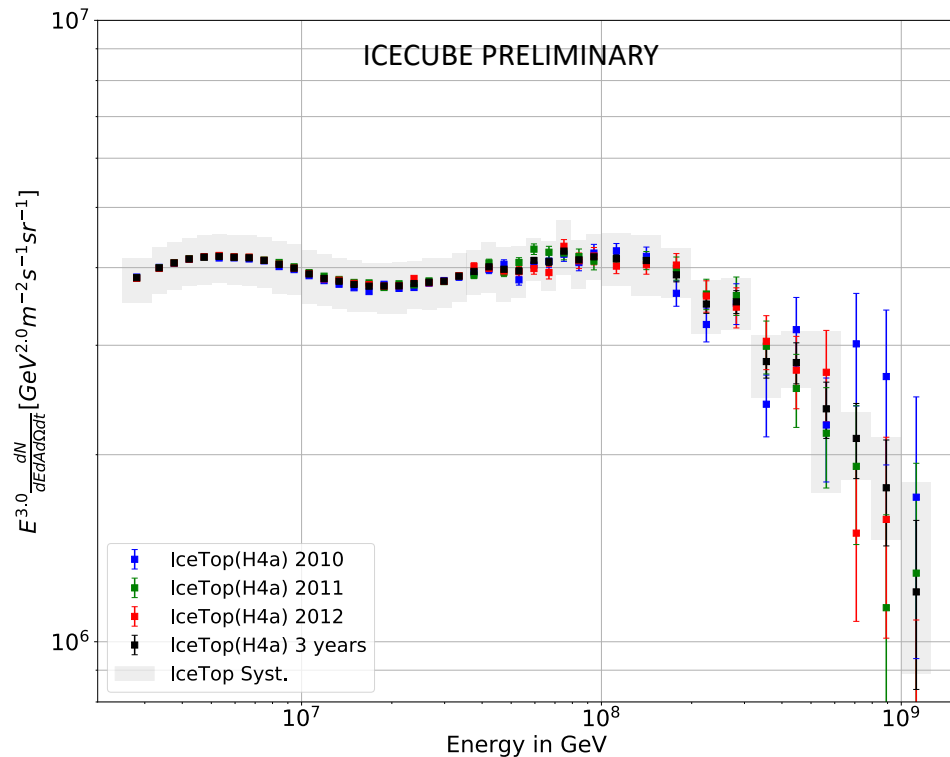

Both analysis method have:

- Similar small energy bias over the whole energy range
- Similar tight resolution

Only small primary composition dependency visible

# IceTop Energy Spectrum

- IceTop Energy Spectrum unfolded using maximum likelihood method. (Composition assumed from H4a model: *T. Gaisser, T. Stanev & S. Tilav: Front. Phys.(Beijing) 8 (2013) 748-758*)
- 3 years of data (May '10 – Jun '13)
- Standard cuts (*IceCube Collab., M.G. Aartsen et al., PRD 88 (2013) 042004*)
- Data set divided into individual years shows strong agreement

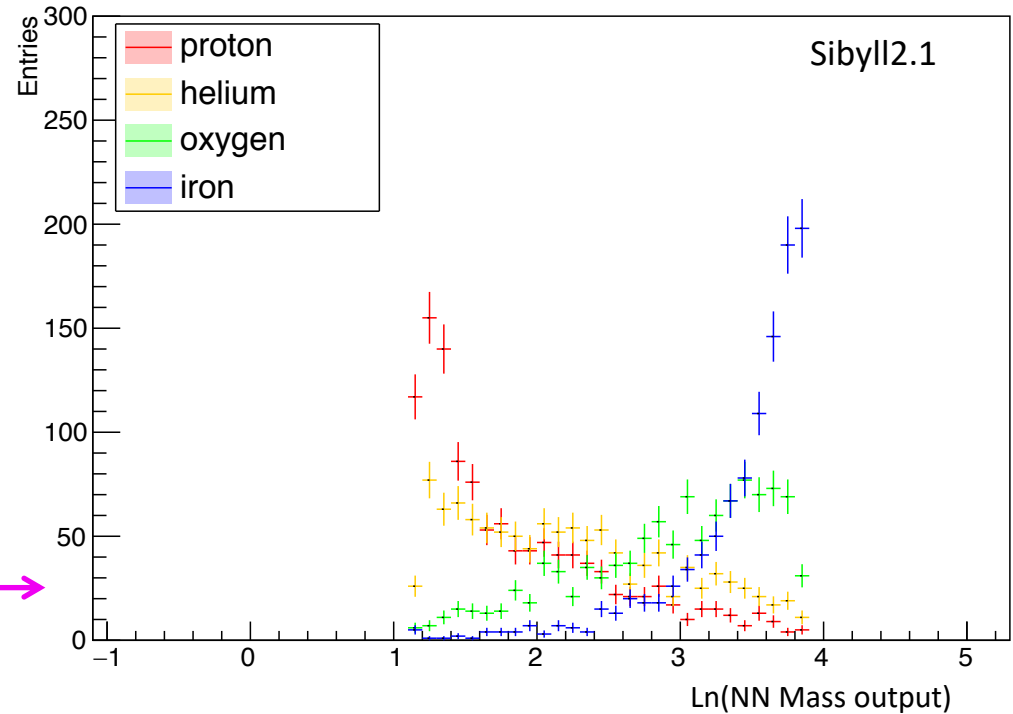

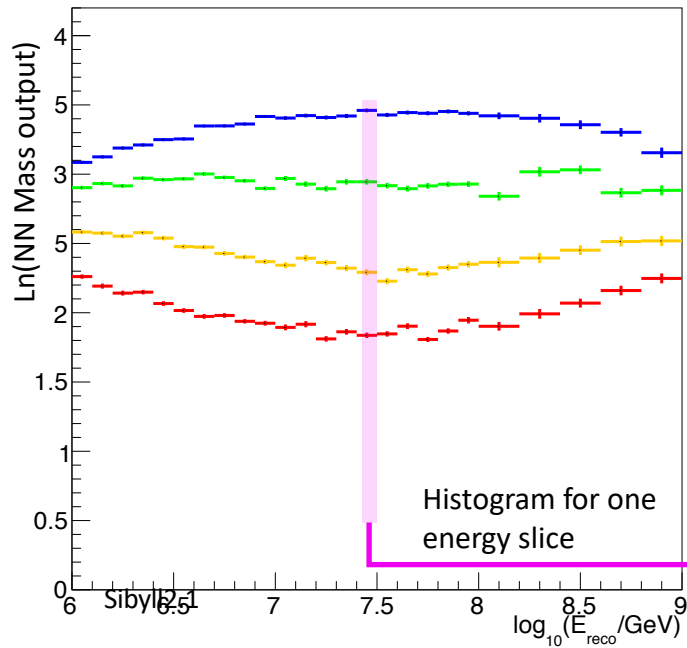

# IceTop/IceCube Energy Spectrum

- 3 years of data (May '10 – Jun '13)
- Standard cuts (*IceCube Collab., M.G. Aartsen et al., PRD 88 (2013) 042004*)
- Due to geometric constraints, energy bin size of coincidence analysis reduced
- Strong agreement between both analysis technique

# Mass Reconstruction

- Mass types reconstruction needs an extra step
  - Event-by-event classification not possible

Analyze mass as a function of energy on statistical bases

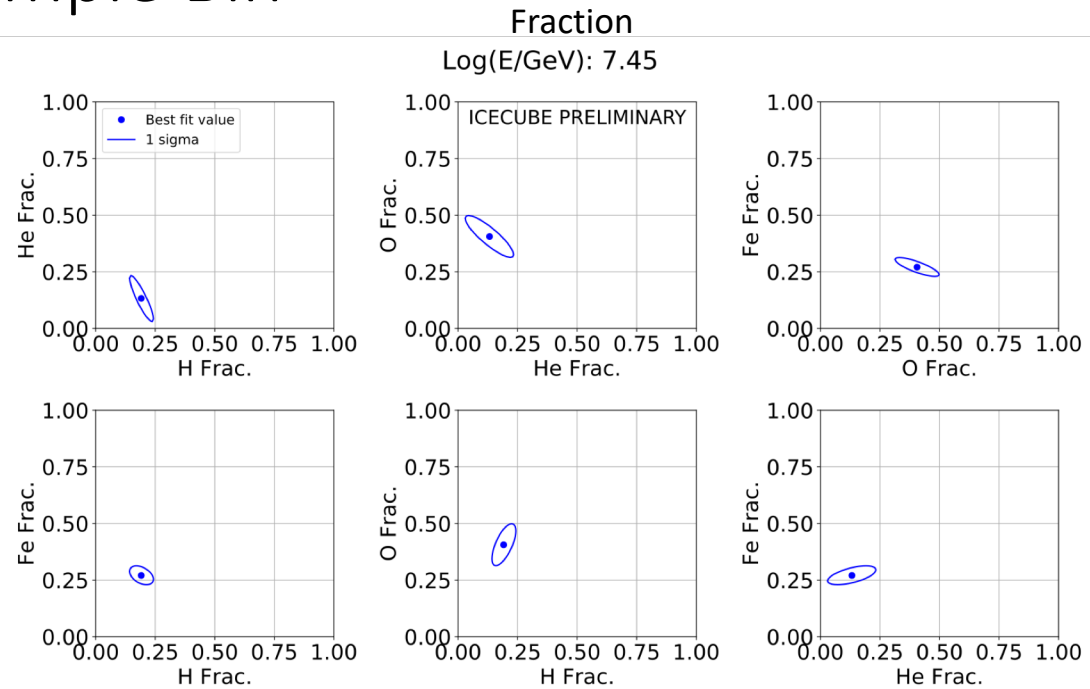

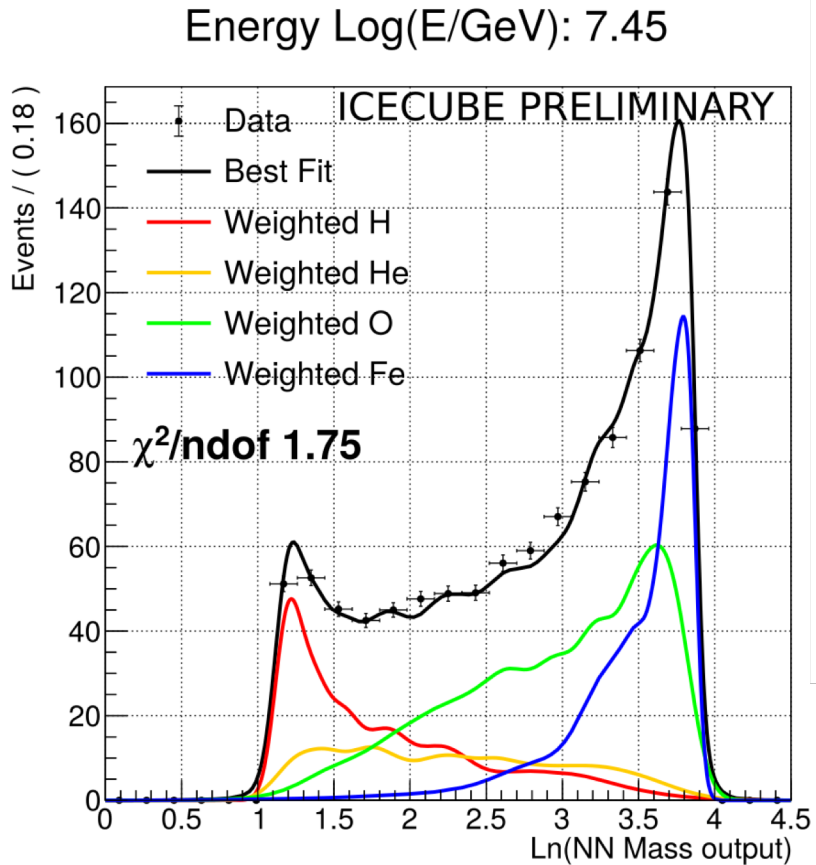

- Monte Carlo data converted into template 'probability density functions' (PDFs) for each primary in each energy bin
- Used adaptive Gaussian kernel width to preserve characteristic features of neural net output
- PDFs used in extended Likelihood data analysis
- Superposition model of weighted primary group PDFs fitted to data result:

$$f(x; \theta) = \sum_{i=1}^m \theta_i f_i(x),$$

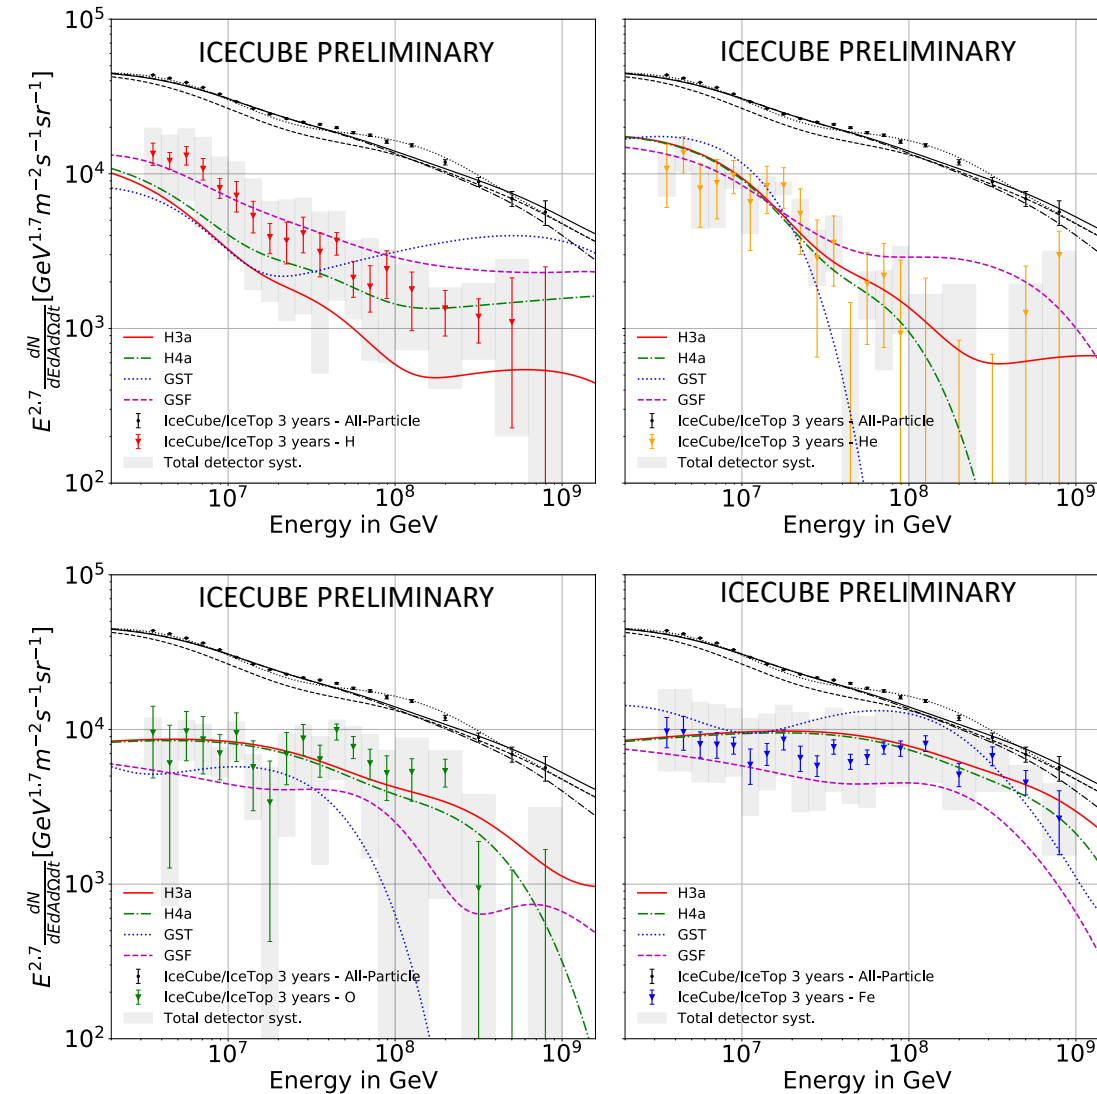

# Application to Data – Example Bin

- Weights correspond to a mass fraction
- Strong correlation between neighboring primary groups

# Composition Energy Spectrum

- Nominal results derived from Sibyll2.1
- Agreement with models within statistical and systematic uncertainty

Models (as discussed in [*Astroparticle Physics 35 (2012) 801–806*])

**H3a** [T. Gaisser, T. Stanev & S. Tilav: *Front. Phys.(Beijing) 8 (2013) 748-758*]

**H4a** [T. Gaisser, T. Stanev & S. Tilav: *Front. Phys.(Beijing) 8 (2013) 748-758*]

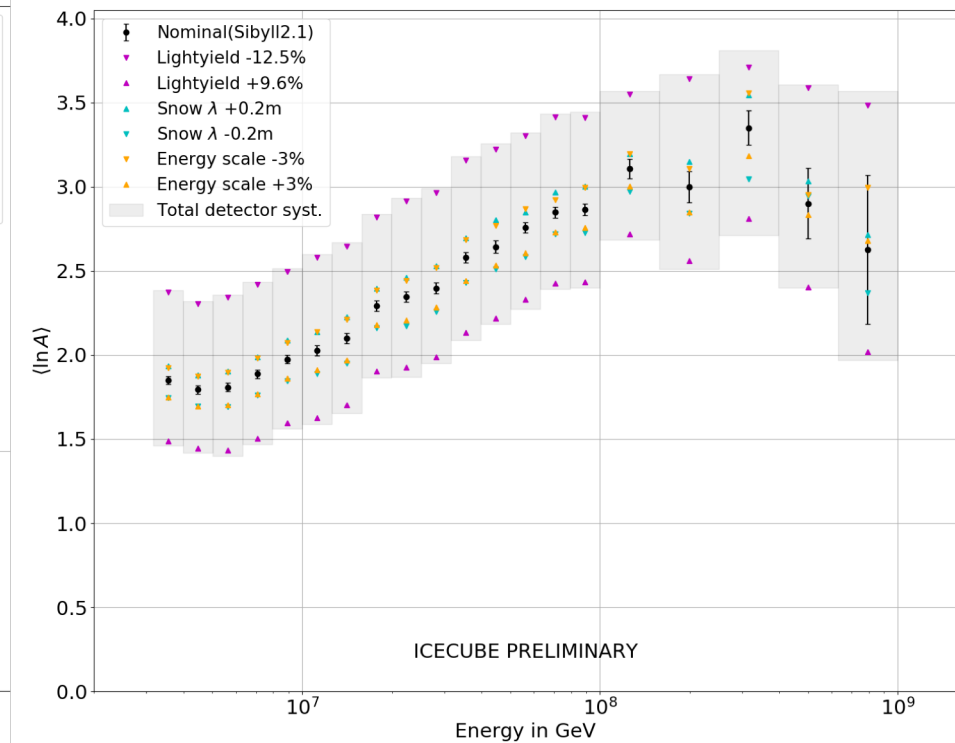

Fits:

**GST** [T. Gaisser, T. Stanev & S. Tilav: *Front. Phys.(Beijing) 8 (2013) 748-758*]

**GSF** (Global Spline Fit) [H. Dembinski, R. Engel, A. Fedynitch, T. Gaisser, F. Riehn, T. Stanev: *PoS(ICRC2017)533*]

# Detector Systematic Uncertainty

Systematic offsets on flux and  $\langle \ln A \rangle$  due to:

- Snow ( $\pm 0.2$  m)
- Light yield (-12.5% , +9.6%)
- Energy scale ( $\pm 3\%$ )

# Hadronic Systematic Uncertainty

Scaling data according to differences in detector response due to interaction models result in uncertainty region in the flux and the  $\langle \ln(A) \rangle$

# Comparison with other Experiments

Overall good agreement of with results from other experiments

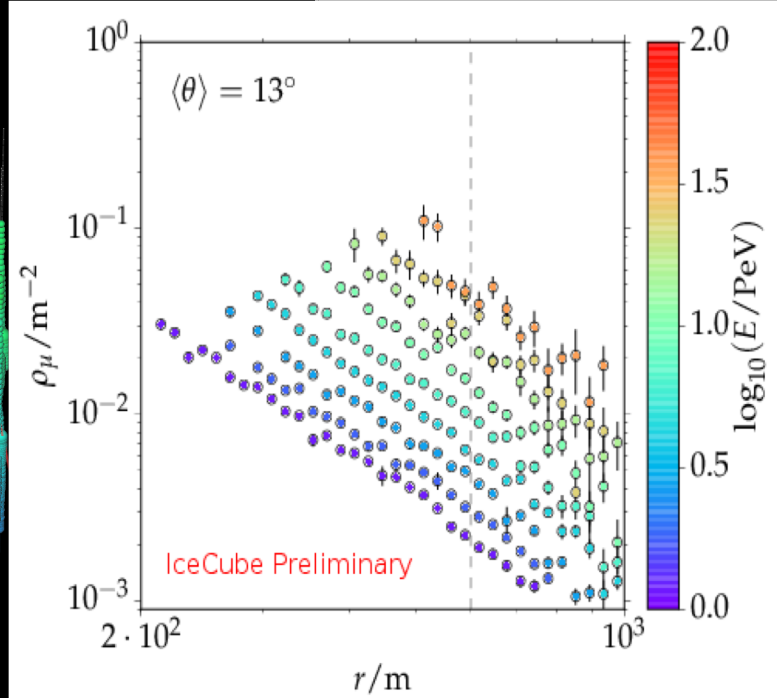

# Comparison with other Experiments

- Composition seems to get heavier with increasing energy up to  $10^8$  GeV

- Overall good agreement with the composition results from most other experiments

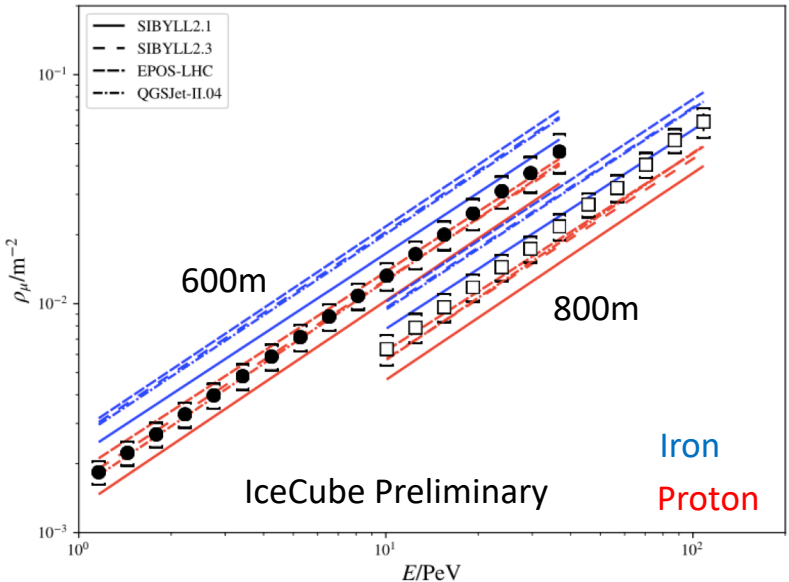

# Muon Density Measurement

**Low Energy Muons (>1GeV) at IceTop**  
At large lateral distance where EM component is no longer dominant, IceTop can directly count the number of low-energy muons, which provides clues about the hadronic interaction models.

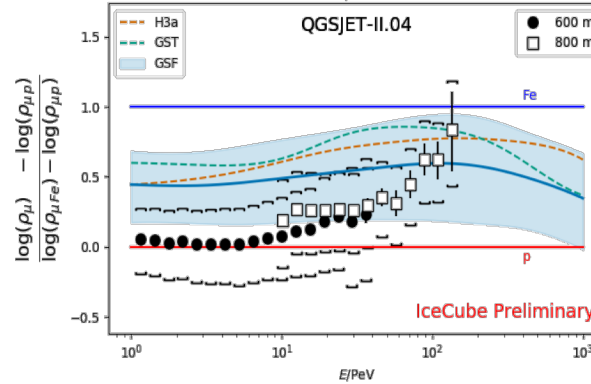

*EPJ Web Conf. 99 (2015) 06002 arXiv:1501.03415*  
*EPJ Web Conf. 145 (2017) 01003*

# Muon Density Measurement

- Charge distribution shows clear single muon peak at large distances to shower core

# Comparing low energy muons with CR Flux Models

- Muon density is very sensitive to the primary mass composition
- Possible test internal consistency of the hadronic interaction model

# PeV Gamma Ray Search

Gamma-ray like shower

Charged Cosmic ray shower

Gamma rays have fewer muons, fewer fluctuations and interact deeper in the atmosphere than hadrons: discrimination using LLH Ratio

Use to build random forest tree classifier

IceTop-IceCube Coincident Events

IceTop Only Events

# PeV Gamma Ray Search

- 5 years of IceCube data analyzed
- ~500k events in final sample
- No significant evidence found to exclude the null hypothesis in
  - All Sky Scan
  - H.E.S.S. Correlation Study
  - HESE Correlation Study

## Analysis field of view

## Scaled Angular-integrated Flux

- Sensitivity of the analysis is calculated to place an upper limit on the flux.

*PoS(ICRC2017)705*

*PoS(ICRC2017)715*

# PeV Neutron Search

- PeV neutrons can be produced by interaction of charged CRs
- Only nearby sources should be detectable ( $R \sim 10 \text{ kpc} (E/\text{PeV})$ )
- Target ( $E > 100 \text{ PeV}$ ) and all-sky ( $E > 10 \text{ PeV}$ ) searches performed

- In 4 years of data (2010-2014)
- No significant correlation is found with known nearby galactic objects
  - Upper limit on the flux calculated  $10 \text{ PeV} < E < 1 \text{ EeV}$

*Astrophysical Journal*, 830:129 (12pp)

# Summary & Outlook

- IceTop+IceCube are versatile cosmic ray detector
- Determine the all-particle cosmic ray flux with two different analysis methods
- Determine the flux of cosmic rays for four mass groups (with representative masses H, He, O, Fe) (publication soon)
- Study the low energy muon content of air showers providing hints to guide interaction model development (publication soon)
- Search for gamma-rays with energy above 1 PeV (publication soon)
- Search for neutrons with energy above 10 PeV (published)

# Backup

# Superposition Model of Mass Composition PDFs

Total PDF for all nuclear mass cosmic rays is given by  
(our model only use 4 typical components (H,He,O,Fe))

$$f(x; \theta) = \sum_{i=1}^m \theta_i f_i(x),$$

Due to the constraint, one fraction parameter can  
be substituted

$$\theta_m, \text{ by } 1 - \sum_{i=1}^{m-1} \theta_i$$

## With Extended LogLikelihood:

- Poisson fluctuations included
- Advantage of extended LL is to have a more symmetrical fit problem (easier fitting and error calculation)
  - 4 free fit parameter

$$\log L(\nu, \theta) = -\nu + \sum_{i=1}^n \log \left( \sum_{j=1}^m \nu \theta_j f_j(x_i) \right)$$

- By using  $\mu_i = \theta_i \nu$

follows 
$$\log L(\mu) = -\sum_{j=1}^m \mu_j + \sum_{i=1}^n \log \left( \sum_{j=1}^m \mu_j f_j(x_i) \right)$$

Fit result gives now the number of events per mass species, which we need for the energy spectrum
