Galactic Tomography

Pulsars:

Dispersion Measure \rightarrow electron density

Rotation Measure \rightarrow magnetic field \times el. dens.

Scintillation Measure \rightarrow el. dens. \times turbulence

Extragalactic sources:

Rotation Measure \rightarrow magnetic field \times el. dens.

Ultra High Energy Cosmic Rays \rightarrow mag. fields

Stars:

Dust reddening \rightarrow dust density & properties

Positions \rightarrow stellar density & radiation field

Kinematics \rightarrow gravitational potential

Emission Processes:

Dust emission \rightarrow dust density & radiation field

Synchrotron \rightarrow relativistic el. \times mag. Fields

Bremsstrahlung \rightarrow thermal, rel. el. \times gas density

Inverse Compton \rightarrow rel. el. \times radiation field

Hadronic interactions \rightarrow rel. nuclei \times gas density

Lines (21 cm, CO, ...) \rightarrow gas density & kinematics

Other information sources:

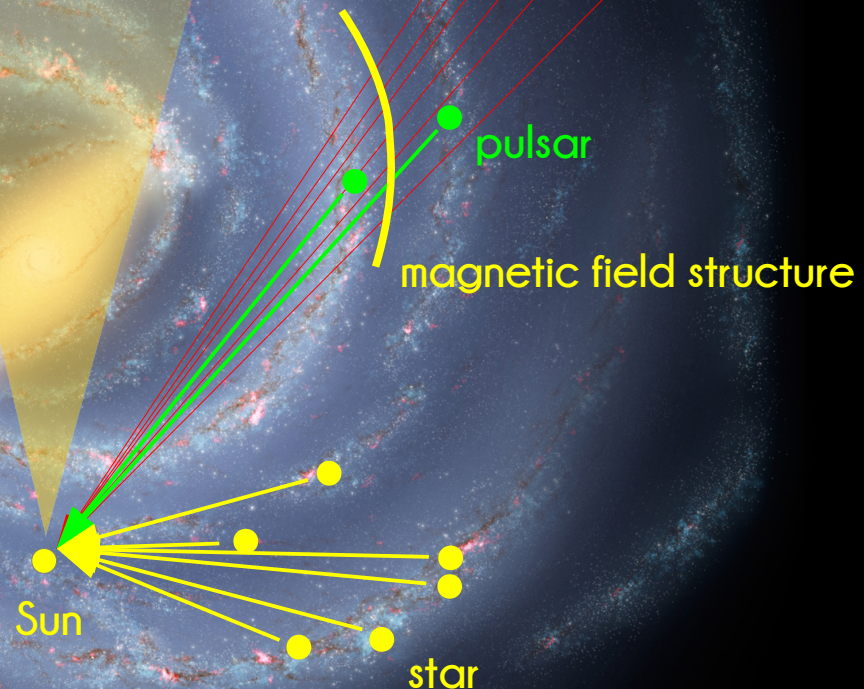

Correlation structures (auto- & cross-correlations)

Approximate symmetries

Physical laws

Empirical laws

...

Information field theory

Information theory for fields

Conclusions

IMAGINE

a framework, a consortium, & a pipeline
for Galactic (magnetic) field inference

so far

parametric model fitting
including non-parametric random magnetic fields

Galactic tomography

is the way to go

requires information theory for fields

→ Information Field Theory (stay tuned)
